

Song Yang

Voltade

Full Stack Software Engineer Intern

I'm happy to share my experience working with Song Yang during his time as a full stack software engineer intern at Voltade. From day one, Song Yang dived right into our EtonHouse AI planner project and started adding value - not just on the technical side, but also by speaking directly with our customers. He built genuine relationships and earned the trust of non-technical users, which is respectable for an intern.

Technical wise, Song Yang is a fast learner. He picked up Hono, OpenAI, TypeScript, React, Supabase, and PostgreSQL for the AI planner, all of which were pretty new to him, but he managed to deliver solid results and contribute code that shipped to real users, culminating in widespread use.

In the middle of his internship, Song Yang worked on Envoy too - our AI chatbot and CRM product, which was on an unfamiliar tech stack to him - Vue.js and Ruby on Rails. He picked that up within a week and started shipping code to production in the following weeks, which is a strong testament to his fast learning ability.

Song Yang is easygoing and able to make friends with about anyone too, not to mention his excellent ping pong skills. I have full confidence that he will be an

asset to any company - given his exceptional technical learning ability, and easygoing attitude.
